

ABSTRACT

The treadmill has a tread base that is rotatably attached to and between a left upright and a right upright. The tread base is rotatable between a first position for performing exercises and an upright or storage position. A latching structure is provided to latch the tread base to the support structure. The treadmill also includes an inclination structure for inclining the tread relative to the support surface when in the first position. The treadmill also includes rigid handles and one configuration movable handles. The tread base also has a rigid undersurface or pan to fully enclose the underside of the tread base. A lift assist gas cylinder is also interconnected between the tread base and the feet attached to the uprights.
